Sequence 2227, Application US/09513999C

Sequence 2227, Application US/09513999C

SENERAL INFORMATION:

APPLICANT: Dunas Mille Edwards, J.B.

APPLICANT: Glordano, J.Y.

TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PATENTE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

CURRENT APPLICATION NUMBER: US/09/513,999C

CURRENT FILING DATE: 200-02-24

PRIOR FILING DATE: 1999-02-26

NUMBER OF SEQ ID NOS: 36681

SOFTWARE: PATENT.

LENGTH: 441

The present sequence is that of a polynucleotide encoding a fragment of novel low density lipoprotein binding proteins (LBPs) of the invention (see AAB82797-820). LBPs are capable of binding to native and methylated low density lipoproteins (LDLs). Isolated polynucleotides encoding novel LBPs and their fragments are claimed, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is a risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LBP are also claimed, as are pharmaceutical compositions comprising an LBP polypeptide or

of double stranded DNA by triple helix formation - comprises ag immobilised oligo-nucleotide to specific sequence in target

Purificn. of hybridising

```
This invention comprises a method of purifying double-stranded DNA from a solution containing the double-stranded DNA mixed with other components, comprising passing the solution through a support comprising a covalently coupled oligonucleotide capable of forming a triple helix with the double stranded DNA by hybridisation with a specific sequence present in the double-stranded DNA. The method is useful for purifying double-stranded DNA contained in a solution and mixed with other components. The new method is a simple, rapid and effective method for DNA purification, and makes it possible to obtain especially high purities with high yields. The method enables DNA to be purified from complex mixtures comprising other nucleic acids, proteins, endocoxins, nucleases and the like. The supports may be readily recycled, and the DNAs obtained display improved properties to pharmaceutical safety. Further, the method entails only one step contrary to prior art. The present sequence represents a DNA sequence contains only interpret sequence contains and purification of the sequence is used for sequence contains the planid pizz752. This sequence is used for
                                                                                                                                                                                                                                                                                                         sequence contained within the plasmid pXL2725. This sequence is used for purification of this plasmid using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Triple helix; triplex formation; Hoogsteen base pairing; plasmid; purification; double-stranded DNA; homopyrimidine; polypurine; ss

acids, proteins, endotoxins, nucleases, etc. by passing the mixture over a support to which an oligonucleotide is covalently attached; the oligonucleotide is able to form a triple helix by hybridisation with a specific sequence present in the dsDNA. The present sequence is a preferred homopurine target for triplex formation with a single-stranded oligonucleotide. The target sequence may be present naturally, e.g. in a plasmid origin of replication, or can be introduced artificially. The method is particularly suited to purification of plasmid DNA 888888888888

containing dsDNA and Purifying double-stranded (ds) DNA from a solution containing dsDNA ar other components, comprises passing the solution through a support comprising a covalently coupled oligonucleotide able to form a triple comprising a covalent helix with the dsDNA.

Example 7.1; Page 20; 40pp; English.

This invention comprises a method of purifying double-stranded DNA from a solution containing the double-stranded DNA mixed with other components, comprising passing the solution through a support comprising a covalently coupled oligonucleotide capable of forming a triple helix with the double-stranded DNA by hybridisation with a specific sequence present in the

```
double-stranded DNA. The method is useful for purifying double-stranded DNA contained in a solution and mixed with other components. The new method is a simple, rapid and effective method for DNA purification, and makes it possible to obtain especially high purities with high yields. The method enables DNA to be purified from complex mixtures comprising other nucleic acids, proteins, endotoxins, nucleases and the like. The supports may be readily recycled, and the DNAs obtained display improved properties to pharmaceutical safety. Further, the method entails only one step contrary to prior art. The present sequence represents the sequence of the plasmid XL2725 verified upon sequencing, this sequence differs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            46

Producing monodispersed preparation of polyanionic polymer for therapy, by expressing vector comprising ligation product of oligonucleotides encoding glutamate/aspartate residues in host cell and isolating the product

Example 7; Fig 8; 74pp; English.

The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 kD. (M) involves inserting into an expression vector (EV) a ligation product formed by ligating together oligonuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating the protein product (P) of EV, where (P) is PP and at least 80% of PP is approximately of the same molecular weight. Also described: (1) a recombinant fusion protein (I) comprising a polyanionic polypeptide and another polypeptide at either one end or at both ends of it; (2) a

```
polyanionic polymer (II) conjugate comprising a polyanionic polymer and Leukine, where the polyanionic polymer is polyglutamic acid or polyaparic acid; (3) a vector (III) comprising a cassette which comprises a nuclectide sequence encoding a polyanionic polymer and at least one other nucleotide sequence, where the polyanionic polymer is polyglutamic acid or polyapartic acid; (4) production of (1); (5) a cell (IV) comprising (III) or a vector that comprises a nucleotide sequence that encodes a polyanionic polymer that is larger than 10 kDa; and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease or ailment in an individual by administering (I) to the individual. (I) is also useful for delivering an effective amount of a pharmaceutically active agent, a therapeutic protein or a drug to a patient in need of it, or for diagnostic and testing or research purposes. AZZ2045 to ABZ2211 and ABB56374 to ABPS6400 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention

```
product formed by ligating together oligonucleotides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating the protein product (P) of EV, where (P) is pp and at least 80% of PP is approximately of the same molecular weight. Also described: (1) and control of comprising a polyanionic polypeptide and recombinant fusion protein (I) comprising a polyanionic polypeptide and polyanionic polymer (II) compuser comprising a polyanionic polymer and polyanionic polymer (II) compuser is polyanionic polymer and the polyanionic polymer is polyanionic polymer and at comprises a nucleotide sequence, where the polyanionic polymer is polyanitamic acid or comprises a nucleotide sequence, where the polyanionic polymer is comprises a nucleotide sequence, where the polyanionic polymer is polyglutamic acid or polyapsartic acid; (4) production of [I); (5) a cell (V) comprising (III) or a vector that comprises a nucleotide sequence that encodes a polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease or ailment in an individual by sequence of the individual. (I) is also useful for delivering an effective amount of a patient in need of it, or for diagnostic and testing or research purposes. ABZ22045 to ABZ22131 and ABPS6374 to a testing or research purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABP56400 represent sequences used in the exemplification of the present

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                            Seguence 45 BP; 0 A; 15 C; 0 G; 30 T; 0 U; 0 Other;

Detecting complementary nucleic acid electrochemically, by immobilizing probe on microelectrode, contacting single-stranded target nucleic acid with probe, and measuring change in oxidation-reduction potential.

Example 1; SEQ ID NO 3; 9pp; Japanese.

The invention relates to detecting a complementary nucleic acid electrochemically, comprising immobilising a probe on a microelectrode, contacting a single-stranded target nucleic acid with the probe, and measuring a change in the oxidation-reduction potential in the microelectrode. The method is useful for detecting a complementary mucleic acid or for disease diagnosis. The method is easy, economical and highly precise. Labeling or modification of the nucleic acid is not required. The method does not require expensive reagents or complicated obseration. The use of the nucleic acid chip reduces the size of the gene diagnosis apparatus making it portable. The present sequence is that of an oligonucleotide probe used in examples of the invention to produce a

of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM) are considered to the S. aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be obtained. Specifically, sequences which are polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer

The invention relates to a multidrug resistance-associated protein 1 (MRP 1) polymucleotide. The polymucleotide is useful in an in vitro method for identifying as single nucleotide polymucphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug

The invention relates to a multidrug resistance-associated protein 1 (MRP of identifying as single nucleotide is useful in an in vitro method for identifying as single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.

The invention relates to an isolated polynucleotide (its complement or a sequence 99% similar to it) coding without interruption for a human x88336 polypeptide, a serine protein kinase, comprising the K88336-1 and K88336-2 splice variants appearing as ABG72382 and ABG72383. Also included is a method of identifying an agent that modulates the expression of K88336; and progenitor or pancreas progenitor calls comprising; (a) contacting a cell population comprising the cells with a test agent under conditions effective for the test agent computates the expression of K88336; The polynucleotides are useful as molecular targets or drug targets, and (b) determining if the test agent capent modulates the expression of K88336; The polynucleotides are useful as molecular targets or drug targets, and for detecting, diagnosing, as molecular targets or drug targets, and for detecting, diagnosing, as molecular targets or drug targets, and for detecting, diagnosing, capent modulates prognosticating, preventing or treating diseases or conditions relating to brain and pancreas, such as astrocytoma, melitue 2, helicotid peripapillary chorioretinal degeneration, Beckwith-Miedemann syndrome or congenital hyperinauliniam. The method and polynucleotides are useful in research, diagnosis, drug discovery, therapy, clinical medicine, forensic science and pathology. The gene for K8B336 is located on chromosome lipis. S-pter. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynuclectide coding without interruption for a human KSE336 polypeptide useful for preventing or treating diseases/conditions relating to brain and pancreas, e.g. meningioma, insulin-dependent diabetes mellitus 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; promoter; ds; chromosome 11p15.5-pter; astrocytoma; meningioma; pancreatic adenocarcinoma; insulin-dependent diabetes mellitus 2; helicoid peripapillary chorioretinal degeneration; brain; pancreas; Beckwith-Wiedemann syndrome; congenital hyperinsulinism; KSE336.
                                                                                                                                                                                                                                                                                                                                                                                   Human serine protein kinase KSE336 promoter fragment #8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 50 BP; 2 A; 17 C; 30 G; 1 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Conservative:

```
The present invention relates to KSE336 polynucleotides encoding serine/
threonine kinase (STK) proteins. Sequences of the invention are useful
tor diagnoshing a brain or pancreas disease associated with abnormal
KSE336, or susceptibility to the disease. They are useful for assessing a
therapeutic or preventative intervention in a subject having a brain or
pancreas disease. The invention is useful for identifying an agent that
modulates the expression of KSE336 in brain or pancreas cells, cells
derived from brain and pancreas or brain and pancreas progenitor cells.
It is useful for detecting polymorphisms in KSE336. It is also useful for
advertising KSE336 for sale, commercial use or licensing. KSE336
sequences are useful to treat diseases such as astrocytoms, meningioma,
pancreatic adenocarcinoma, insulin-dependent diabetes mellitus, Beckwith-
Wiedemann syndrome or congenital hyperinsulinism. They are also useful in

```
This invention relates to a novel isolated serine protein kinase polymucleotide KSE336 exhibiting serine or threonine kinase activity, coding without interruption a fully defined sequence of 668 amino acids or 585 amino acids as given in the specification. The invention may be useful for the development of compounds with an antidiabetic activity or for use in gene therapy, a vaccine or immunotherapy. The invention is useful for diagnosing a brain or pancreas disease associated with abnormal KSE336, or susceptibility to the disease, which involves assessing the expression of the nucleotide of the invention in a tissue pancreas or brain, and comparing the expression to the expression of the gence of a known normal tissue. The disease is astrocytoma, meningioma, gene of a known normal tissue. The disease is astrocytoma, meningioma, wiedemann syndrome or congenital hyperineulinaemia. The present sequence is a human KSE336 promoter sequence which is related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated serine protein kinase polynucleotide KSE336 present in brain and pancreas, and exhibiting serine or threonine activity, useful for diagnosing and treating diseases related brain and pancreas.

(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarese gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AP129072.1) a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xil0-Gold (Stratagene) cells
and selected for ampicillin resistance."

Submitted (31-MRR-2004) Weisshaar B., Max-Planck-Institut fuer Submitted (31-MRR-2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the right border of the T-DNA. Details on the protocols used for generation of the sequence are described in References 1.3. Re-examination of the source from which this sequence has been produced indicates that the sequence is of low reliability. Therefore, no information on a potential insertion site is deduced. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI-Kat information on line availability can be found at: location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="PCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC106 (GenBank accession number: AJ537513). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequence to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TA33D12P 49 bp DNA linear GSS 13-DEC-2000 T. brucei sheared genomic DNA clone 33d12, forward sequence, genomic survey sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwayed (gql 4732114|gbl A7129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AL752522 48 bp DNA linear GSS 31-MAR-2004
Arabidopsis thaliana T-DNA flanking sequence GK-014A05-012792,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Arabidopsis thaliana

This sequence has been recovered from the left border of the T-DNA.
Details on the protocols used for generation of the sequence are
described in References 1-3. Re-examination of the source from
which this sequence has been produced indicates that the sequence
is of low reliability. Therefore, no information on a potential
insertion site is deduced. The sequences are generated at the MPI
for Plant Breeding Research in the context of the GABI-Kat project.
GABI-Kat is part of the German Plant Genomics program designated
'GABI'. Information on line availability can be found at:

The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CR154670 50 bp DNA linear GSS 06-JUL-2004

Constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREB1927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWAD42 (gil-4732114[gb]AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xillo-Gold (stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GSS 05-OCT-2000

/ note="WetCor: PWD4Znv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifica at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AZ764533 49 bp DNA linear GSS 16-FEB-2001 IM0560017R Mouse 10kb plasmid UUGCIM library Mus musculus genomic

// note="Wouse DAN Resource
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gel 4732114|gbh AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xili0-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1M0532M11R Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0532M11 R, genomic survey sequence.

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonicleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732114) [gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 34, A

Sequence 9, Application US/08068747

Patent No. 5695933

GENERAL INFORMATION:
APPLICANT: Schalling, Martin
APPLICANT: Hudson, Thomas J.
APPLICANT: Housman, David E.
TITLE OF INVENTION: Direct Determination of Expanded
TITLE OF SEQUENCES: 11

CORRESPONDENCES: 11

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STATE: Massacnusett
COUNTRY: USA
ZIP: 02173
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/068,747
FILING DATE: 28-MAY-1993
CLASSIPICATION: 435
ATTONNEY/AGENT INFORMATION:
NAME: Granahan Patricia
REGISTRATION NUMBER: 32,227
REFERENCE/DOCKET NUMBER: 32,227
REFERENCE/DOCKET NUMBER: 32,227
REFERENCE/DOCKET NUMBER: 31,227
RELEPAK: 617-661-6540
INFORMATION FOR SEQ ID NO: 9:
SEQUENCE CHARACTERISTICS:
LENGTH: 39 base pairs
TTELEPAK: nucleic acid
STRANDBNESS: single
TTELOGOCY: linear
TOPIC/CY: linear
TOPIC/CY: linear
